

Final Report  
ONR Contract No. 0014-82-K-0612  
Charles R. Martin  
Department of Chemistry  
Texas A&M University

Summary 1990

The objectives of the proposed research were to explore the electrochemical and optical properties of ensembles of nanoscopic metallic particles and in an earlier phase to explore ion and electron transport in polymers. Accomplishments have been reviewed in 57 technical reports and 57 publications. Thus, an extensive review is not warranted here. Suffice it to say that we have demonstrated the ensembles of nanoscopic metallic particles can function as "ultramicroelectrodes" and that the ultramicroelectrode ensembles have interesting and useful electrochemical properties. We have also shown that these ensembles can function as transparent metal films.
